Hello Mark,

Thank you for getting in touch.

There are a number of reasons for high electricity usage, the most common are:

- UFH (Under Floor Heating)
- Immersion heater being left on
- Any type of electrical heating that is being used, including anything that is on a timer
- A new appliance that could be faulty and causing a high consumption

The meter may be inaccurate and we can perform an accuracy test, however, 87% of meters tested are found to be accurate. If the meter is found to be accurate than the cost of the test is passed onto the customer which is £192.

Creep Test (Both Gas & Electricity)

To carry out this test:

- For electric, switch off all circuits of their fuse box.
- For gas, turn off all heating and gas appliances.
- Leave it for about 5 - 10 minutes, then check the reading on the electric / gas meter.

- If the reading has continued to move, it's highly likely the meter is faulty.
- If it didn't move, it's less likely that the meter is inaccurate.

It can also help to take pictures of the meter both times you check it, and if there is a significant difference (so more than a few units) you can pop the pictures over to us to have a little check over.

Load Test

When turning the appliances back on, turn them on one by one and leave 10-15 minutes between each. Check the meter each time, and see if there is a particular appliance that has caused a jump in usage. If so, in all likelihood, that is the cause of your slightly bigger bills! If either of these come back as showing slight irregularity, there are further tests we can provide as a company to ensure the meter itself is accurate.

Onsite Accuracy Test (Electricity Only)

- We can arrange for an onsite accuracy test. An engineer will come out to determine if the meter is inaccurately measuring the energy consumption. If the meter is clocking fast, we'll backdate your usage and write off a portion of the bill.
- If the meter is found to be accurate the cost of this is billed to the customer and costs £80.

OFMAT (Gas Only)

- The gas meter is removed and replaced. The old meter is sent for testing at a third party laboratory operated by SGS. After they have completed testing, they send a letter to Octopus and the customer with the outcome of the tests. This takes between 6 - 8 weeks after the meter is removed.
- If the meter is found to be accurate the cost of this is billed to the customer and costs £192.

Please let me know if you have any questions or if you want to go ahead with any of the above tests.

Love and Power,
Chantelle
